Experimental results

Binaural Noise Reduction

Relative Transfer Functions (RTFs)

The relative transfer function (RTF) vectors, relating the ATF vector to the reference microphones, are defined as:

$$\mathbf{h}_{L} = \frac{\mathbf{a}}{A_{L}} = \begin{bmatrix} 1, \frac{A_{L,2}}{A_{L}}, \dots, \frac{A_{L,M_{L}}}{A_{L}}, \frac{A_{R,1}}{A_{L}}, \dots, \frac{A_{R,M_{R}}}{A_{L}}, \frac{A_{e}}{A_{L}} \end{bmatrix}^{T}$$
$$\mathbf{h}_{R} = \frac{\mathbf{a}}{A_{R}} = \begin{bmatrix} \frac{A_{L,1}}{A_{R}}, \dots, \frac{A_{L,M_{L}}}{A_{R}}, 1, \frac{A_{R,2}}{A_{R}}, \dots, \frac{A_{R,M_{R}}}{A_{R}}, \frac{A_{e}}{A_{R}} \end{bmatrix}^{T}$$

Relative Transfer Functions (RTFs)

The relative transfer function (RTF) vectors, relating the ATF vector to the reference microphones, are defined as:

$$\mathbf{h}_{L} = \frac{\mathbf{a}}{A_{L}} = \begin{bmatrix} 1, \frac{A_{L,2}}{A_{L}}, \dots, \frac{A_{L,M_{L}}}{A_{L}}, \frac{A_{R,1}}{A_{L}}, \dots, \frac{A_{R,M_{R}}}{A_{L}}, \frac{A_{e}}{A_{L}} \end{bmatrix}^{T}$$
$$\mathbf{h}_{R} = \frac{\mathbf{a}}{A_{R}} = \begin{bmatrix} \frac{A_{L,1}}{A_{R}}, \dots, \frac{A_{L,M_{L}}}{A_{R}}, 1, \frac{A_{R,2}}{A_{R}}, \dots, \frac{A_{R,M_{R}}}{A_{R}}, \frac{A_{e}}{A_{R}} \end{bmatrix}^{T}$$

Last entry relates the eMic to the (head-mounted) reference microphones and needs to be estimated

Nico Gößling	19-08-2017	Binaural Noise Reduction	7/15

Binaural MVDR Beamforming

- Minimizing output noise power
- Preserving speech component in reference microphone signals

Optimization problem for left filter

$$\mathbf{w}_{L} = \arg\min_{\mathbf{w}} \mathcal{E}\left\{ \left| \mathbf{w}^{H} \mathbf{n} \right|^{2} \right\} \quad \text{s.t.} \quad \mathbf{w}^{H} \mathbf{x} = X_{L}$$

Solution for left filter

$$\mathbf{w}_L = \frac{\mathbf{R}_n^{-1}\mathbf{a}}{\mathbf{a}^H \mathbf{R}_n^{-1}\mathbf{a}} A_L^* = \frac{\mathbf{R}_n^{-1}\mathbf{h}_L}{\mathbf{h}_L^H \mathbf{R}_n^{-1}\mathbf{h}_L}$$

RTF vector construction

- Fixed beamforming for head-mounted microphones, e.g, based on direction-of-arrival θ (DOA) estimation
- RTFs can be measured or simulated in advance
- Not possible for eMic \Rightarrow **RTF** estimation is needed

$$\mathbf{y} = \begin{bmatrix} \mathsf{DOA} \text{ est.} & \mathbf{\bar{h}}_{L}(\theta), \ \mathbf{\bar{h}}_{R}(\theta) \\ \\ \mathsf{RTF} \text{ est.} & H_{e,L}, \ H_{e,R} \end{bmatrix} + \begin{bmatrix} \mathbf{\tilde{h}}_{L}, \mathbf{\tilde{h}}_{R} \\ \\ \end{bmatrix}$$

Motivation	Binaural Noise Reduction	RTF estimation methods	Experimental results
Nico Gößling	19-08-2017	RTF estimation methods	10/15

RTF estimation methods

Ground truth:

$$H_{e,L} = \frac{\mathbf{e}_{e}^{T} \mathbf{R}_{x} \mathbf{e}_{L}}{\mathbf{e}_{L}^{T} \mathbf{R}_{x} \mathbf{e}_{L}} = \frac{A_{e}}{A_{L}}$$

• Biased approach:
$$H_{e,L}^{b} = \frac{\mathbf{e}_{e}^{T} \mathbf{R}_{y} \mathbf{e}_{L}}{\mathbf{e}_{L}^{T} \mathbf{R}_{y} \mathbf{e}_{L}}$$

• MVDR pre-processing approach:
$$H_{e,L}^{pp} = \frac{\mathbf{e}_e^T \mathbf{R}_y \mathbf{w}_{H,L}}{\mathbf{w}_{H,L}^H \mathbf{R}_y \mathbf{w}_{H,L}}$$

• Covariance whitening approach:
$$H_{e,L}^{cw} = \frac{\mathbf{e}_e^T \mathbf{R}_n^{1/2} \mathbf{v}_{max}}{\mathbf{e}_I^T \mathbf{R}_n^{1/2} \mathbf{v}_{max}}$$

Experimental results

12/15

Experimental setup

- Male target speaker
- Diffuse babble noise
- $M_L = M_R = 2$
- T60 = 350 ms
- 16 kHz @ 16 ms (50% OL)

19-08-2017

- Assuming $\theta = 35^{\circ}$
- **R**_n estimation during 2 s noise-only initialization
- **R**_y estimation during 18 s speech-plus-noise
- Batch filtering

Experimental results

Conclusion and Outlook

Conclusion:

- It is possible to estimate RTFs and incorporate an eMic into a binaural MVDR beamformer in an experimental scenario based on real-world signals
- **②** Pre-processing proved beneficial compared to baised approach
- Covariance whitening outperformed the other approaches
 Outlook:
 - O Directional noise sources (extended BLCMV beamformer)
 - Practical problems, e.g. synchronization (influence of clock drift/offset), online implementations and dynamic scenarios
